
Frontal Hair Loss Report

Problem Detected: Frontal Hair Loss

Hairline recession or thinning in the front area is noticed.

This is often caused by genetics, stress, or hormonal changes.

Made with GAMMA

Solution

PRP

Uses your own platelet-rich plasma to deliver concentrated growth factors to the scalp.
Helps control hair fall, strengthen weak roots, and improve overall follicle activity.

GFC

Uses concentrated growth factors to stimulate weak follicles and support natural regrowth.
Helps improve hair thickness, density, and overall hair quality over time.

Mesotherapy

Delivers essential nutrients directly into the scalp to improve nourishment where it is needed most.
Supports scalp health, improves root nutrition, and helps create a better environment for hair growth.

Hair Transplant

A procedure that moves healthy hair follicles from one area to the thinning or bald area.
It helps restore natural-looking hair growth in advanced stages of hair loss.

Combination treatment may be recommended.

Made with GAMMA

Stage & What You Should Do

Early Stage

What to do:
Hair thinning has just started, and hair roots are still active.

Why this helps:
OLT + scalp care can help control thinning. and improve hair strength.

Moderate Stage

What to do:
Hair density is visibly reduced, and the follicles are becoming weak.

Why this helps:
PRP / GFC treatments can help strengthen the roots and support better regrowth.

Advanced Stage

What to do:
Clear thinning or bald areas are visible, and some follicles may be inactive.

Why this helps:
Hair Transplant can help restore hair in these areas and improve overall coverage.
